Practical-6

The luggage sharing platform with flights, bookings, and security features

Excess Air (WT Project)

1. Introduction:

ExcessAir is a digital platform designed to facilitate luggage sharing for air travelers. It connects travelers who have extra luggage space with people who need to send items via flights. By listing their available flight details and luggage capacity, travelers can offer space for bookings, while senders can securely book space without relying on traditional courier services. The platform enhances convenience, reduces luggage costs, and ensures secure transactions with proof of flight tickets.

---

2. Abstract:

The project aims to develop a modern web-based application to manage luggage sharing efficiently. The system allows travelers to upload flight details, ticket proofs, and available luggage space. Senders can search for flights and book space for their items, with payments processed online securely. All data is stored in a MySQL database and is managed through a PHP-based backend. The admin can monitor listings, manage users, and track transactions. The project uses **HTML, CSS, JavaScript, PHP, and MySQL** to provide a responsive and user-friendly experience.

---

3. Objective and Motivation:

Objective:

- To create a secure and reliable platform for luggage sharing.
- To make air travel more economical by reducing luggage costs.
- To facilitate real-time bookings and easy payment processing.

Motivation:

- Many travellers face high baggage fees or underutilized luggage space.
- People often need fast and secure ways to send items via flights without relying on courier services.
- With growing demand for convenience and online solutions, ExcessAir provides a safe, time-saving, and cost-efficient solution for both travelers and senders.

4. System Architecture:

The system architecture consists of three main components:

1. **Frontend:**
   - Developed using **HTML, CSS, and JavaScript**.
   - Provides a user-friendly interface for travelers and senders to list flights, search for bookings, and make payments.
2. **Backend:**
   - Built with **PHP** to handle server-side processing, including flight listing management, booking requests, payment verification, and user authentication.
3. **Database:**
   - **MySQL** stores user information, flight listings, booking details, ticket proofs, and payment data.

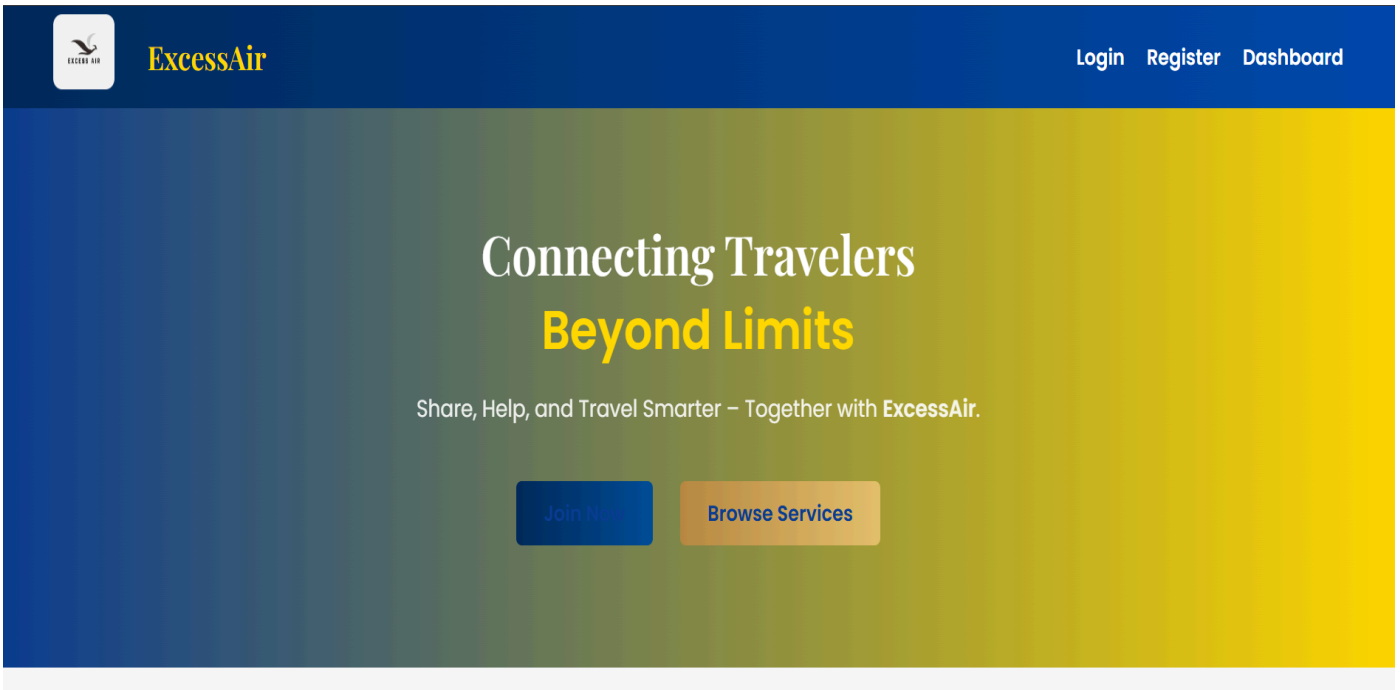
Workflow:

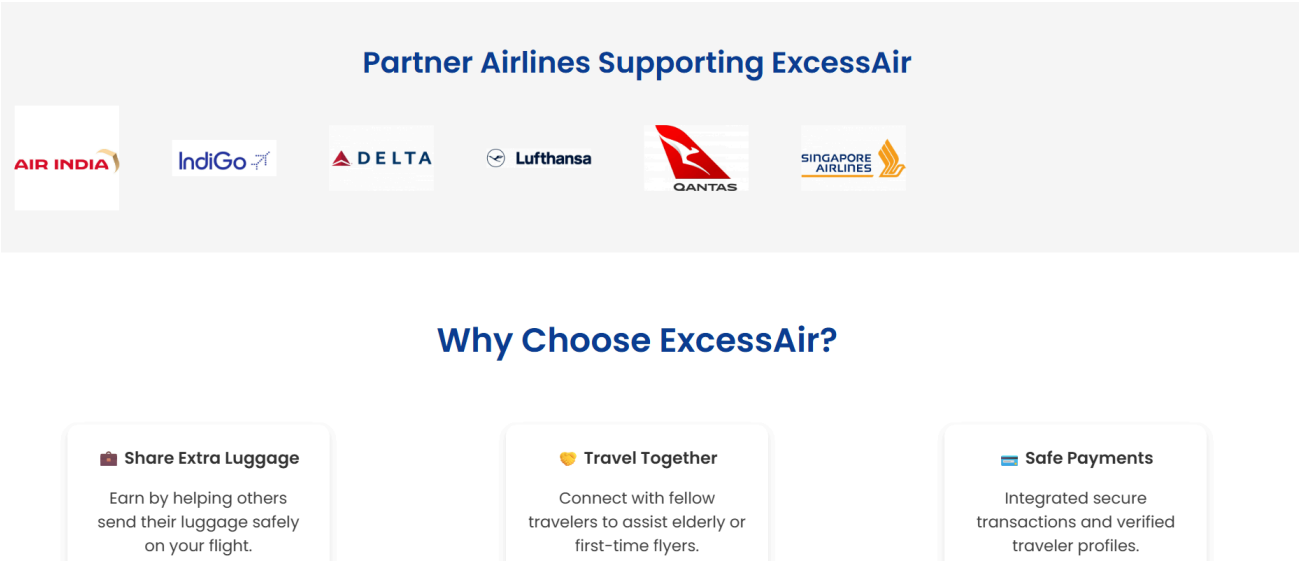
- Travelers add flight details and available luggage space.
- Senders search for flights, select the required space, and book it.
- Payment is made through a secure gateway.
- Admin monitors and manages all users, bookings, and listings.

5 . Output Screenshots : -

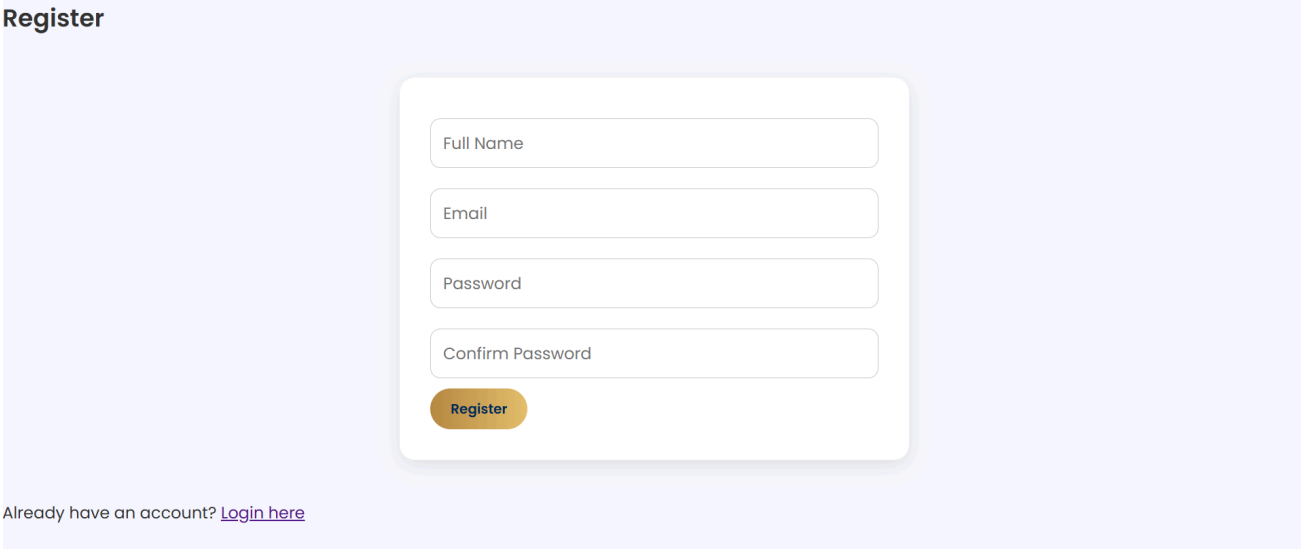
Below are placeholders for screenshots that demonstrate the working of the system:

- Screenshot 1 : Landing Page





Screenshot 2: Contact info page



- **Screenshot 3** : Dashboard

6. Conclusion:

The **ExcessAir Luggage Sharing Platform** successfully streamlines the process of sharing luggage space among travelers, offering a secure and convenient way to manage excess baggage. The system enhances user experience by allowing easy booking, ticket verification, and communication between travelers. It also reduces costs and promotes sustainable travel by optimizing luggage space. Future improvements could include integrating multiple payment options, adding real-time tracking of shipments, and implementing AI-based route optimization for better efficiency.

7. Flaws / Limitations of the Website:

1. The platform currently requires an active internet connection to function.
2. Handling multiple concurrent bookings during peak travel times may be limited.
3. The mobile interface could be further optimized for smoother usability.
4. Payment gateway integration is not yet implemented.
5. Real-time tracking and automated notifications are still under development.
